

[PROJECT / PRODUCT]

Project repository: [owner/repository] • Owner: [responsible person/team]

PURPOSE [Who this serves, the outcome it promises, and its distinguishing principle.]

BOUNDARY [What this contract includes; what it deliberately does not own.]

FOUR SQUARES

01 SPEC / spec-vN Owns binding intent, scope and contracts. Gate: stable clauses + scoped acceptance criteria.	02 [LANE A] / lane-a-vN Owns the primary implementation or deliverable. Gate: the declared deliverable passes its checks.
03 [LANE B] / lane-b-vN Owns the second durable project concern. Gate: usable, aligned and independently checked.	04 MEMORY / memory-vN Owns recall, decisions, examples and evidence links. Gate: understandable; no new law outside SPEC.

SPEC + MEMORY are fixed; the two middle lanes are project-defined. Branch suffix vN follows the project, not the FSL template version.

BINDING CONTRACT

MUST / **MUST NOT** = binding • **SHOULD** / **SHOULD NOT** = guidance • **MAY** = permission

STABLE CLAUSE ID	REQUIREMENT / PROMISE	VERIFICATION
LAW-[SCOPE]-001	[Subject] MUST [observable requirement].	[Check / evidence path]
CONTRACT-[SCOPE]-002	[Interface] MUST [observable promise].	[Acceptance evidence]
GUARD-[SCOPE]-003	[Operation] MUST NOT [forbidden effect].	[Negative / boundary test]

SPEC governs. Binding requirements **MUST NOT** be silently weakened; missing evidence is **NOT YET PROVEN**.

DEV STRATEGY / INITIAL ITERATION

I-001: tiny [input] → [required touchpoints] → [observable output] → prove → grow.

Parallel E2E / E2M / M2E **MAY** be used. M = named midpoint contract. Partial or component proof is not E2E. No full iteration plan is required.

TECHNOLOGIES, LIBRARIES & REFERENCES

ITEM	INTENT / USE	SOURCE
[Technology / library]	[MUST / SHOULD / MAY] [purpose]	[Canonical link / source ID]
[Existing capability]	[REUSE / INHERIT / REFERENCE]	[Source; pin only if needed]

Only essential choices belong here. A category or link alone creates no obligation; a binding choice needs a SPEC clause ID.

LIFECYCLE / RELEASE CHECK

Draft → Prove → Release → Appendix / Errata / Amendment → Next Release.

[] SPEC stable [] LANE A verified [] LANE B usable and aligned [] MEMORY understandable

Status: **NOT YET PROVEN** | Evidence / exact four-commit snapshot: [project-local path].

main1 = this repository's first commit, fixed. Four lane branches vN → matching lanes vN+1. main = accepted integration after gates.
