

A pragmatic Python web framework — illustrative Four-Square overlay, not upstream branch practice.

FOUR-SQUARE RELEASE LINEAGE

| main1 = repository first commit / immutable root reference |         |         |         |           |
|------------------------------------------------------------|---------|---------|---------|-----------|
| V1                                                         | spec-v1 | code-v1 | docs-v1 | memory-v1 |
| V2                                                         | spec-v2 | code-v2 | docs-v2 | memory-v2 |

SPEC + MEMORY are fixed. The two middle lanes are project-defined and remain stable across versions.

|                                                                      |                                                                                |                                                                                                  |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>MISSION</b><br>Represent a coherent Python web framework surface. | <b>CORE PRINCIPLE</b><br>Keep code, public behavior and documentation aligned. | <b>BOUNDARY</b><br>Illustrative mapping only; application-specific policy is outside the sample. |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|

REPRESENTATIVE WORKFLOWS

| ITEM               | PROVEN SOURCE / MECHANISM    | REQUIRED OUTCOME                                      |
|--------------------|------------------------------|-------------------------------------------------------|
| Request → response | routing + views + middleware | HTTP request follows a deterministic framework path.  |
| Model ↔ database   | ORM + migrations             | Declared model state maps to database operations.     |
| Template rendering | template engine              | Context renders under documented escaping rules.      |
| Forms / validation | forms + validators           | Input is parsed and errors are surfaced consistently. |
| Testing            | Django test utilities        | Behavior can be exercised reproducibly.               |

FOUR-SQUARE RESPONSIBILITIES

| SPEC<br>spec-vN                                          | CODE<br>code-vN                                                   | DOCS<br>docs-vN                                                    | MEMORY<br>memory-vN                                       |
|----------------------------------------------------------|-------------------------------------------------------------------|--------------------------------------------------------------------|-----------------------------------------------------------|
| Contract, workflows, invariants and acceptance criteria. | Framework implementation, tests, migrations and runtime behavior. | Guides, tutorials, references, release notes and upgrade guidance. | Human + AI glossary, mnemonics, examples and recall maps. |

**ONE VERSION · FOUR SQUARES · ALL GREEN**  
Draft ≠ Tested ≠ Accepted ≠ Released. Conformance is the arbiter.

| CAPABILITY / EVIDENCE DETAIL                          |                                                                           |                                                             |
|-------------------------------------------------------|---------------------------------------------------------------------------|-------------------------------------------------------------|
| MISSION<br>Use only when Page 1 would become crowded. | CORE PRINCIPLE<br>Preserve the same visual identity and template version. | BOUNDARY<br>Add detail; do not introduce a second contract. |

LANE SELECTION RULES

| ITEM                        | PROVEN SOURCE / MECHANISM              | REQUIRED OUTCOME                                                   |
|-----------------------------|----------------------------------------|--------------------------------------------------------------------|
| code-vN                     | Primary project-specific concern       | Narrow, durable branch token.                                      |
| docs-vN                     | Second project-specific concern        | Independent concern that can validate itself.                      |
| ai-vN                       | Umbrella for agents + skills + plugins | Use only when multiple AI-facing artifact classes belong together. |
| tools / code / docs / utils | Examples, not fixed names              | Choose the narrowest stable project term.                          |

EVIDENCE / COMPATIBILITY

| LANE                                                                                                        | VALIDATION                           | RESULT                                      |
|-------------------------------------------------------------------------------------------------------------|--------------------------------------|---------------------------------------------|
| SPEC                                                                                                        | schema / lint / contract consistency | Normative behavior coherent.                |
| CODE                                                                                                        | project-specific tests/build checks  | Primary deliverable proves itself.          |
| DOCS                                                                                                        | project-specific coverage/validation | Second lane proves itself.                  |
| MEMORY                                                                                                      | glossary / link / recall-map checks  | Recall aids stay aligned and non-normative. |
| ONE VERSION · FOUR SQUARES · ALL GREEN<br>Draft ≠ Tested ≠ Accepted ≠ Released. Conformance is the arbiter. |                                      |                                             |
