

[PROJECT / PRODUCT]

Project repository: [owner/repository] / Owner: [responsible person or team]

PURPOSE [Who this serves and the observable outcome it promises.]
BOUNDARY [In scope / out of scope; the boundaries of the contract and proof.]

FOUR SQUARES

01 SPEC / spec-vN FSL / Scope / Contracts / Acceptance / Routes Optional: Appendix / Errata / Amendments	02 SYSTEM / system-vN Product / Runtime / Data / API / UI / Build Gate: deliverable and product checks
03 AI / ai-vN Instructions / Agents / Skills / Prompts / Evals Gate: usable capability; declare inactivity	04 MEMORY / memory-vN Decisions / Rationale / Context / Evidence links Gate: reliable recall; no new law

SPEC + MEMORY fixed; SYSTEM + AI recommended. Replace middle lanes only for a durable concern; ownership follows purpose, not author.

BINDING CONTRACT

MUST / **MUST NOT** = binding / **SHOULD** / **SHOULD NOT** = guidance / **MAY** = permission

CLAUSE ID	REQUIREMENT / PROMISE	VERIFICATION
LAW-[SCOPE]-001	[Subject] MUST [observable requirement].	[Check / evidence]
CONTRACT-[SCOPE]-002	[Interface] MUST [observable promise].	[Acceptance check]
GUARD-[SCOPE]-003	[Operation] MUST NOT [forbidden effect].	[Boundary test]

E2E ROUTES / VISIBLE TOUCHPOINTS

R-01 [input] -> [touchpoint 1] -> [touchpoint 2] -> [observable output]

Expected: [asserted outcome + boundary]. Route baseline: [SPEC/version or exact reference].
Every run shows every declared point: PASS / FAIL / NOT RUN + evidence. Listing points or passing a component test is not E2E proof.

ADOPTION / DEVELOPMENT STRATEGY

New: I-001 -> tiny R-01 -> verify -> grow. Existing: study -> adoption baseline -> verify R-01; iterations optional. Parallel / E2M / M2E **MAY** help.

ESSENTIAL TECHNOLOGIES / REFERENCES

ITEM	INTENT / USE	SOURCE
[Technology / library]	[MUST / SHOULD / MAY + use]	[Canonical source / clause]
[Proven capability]	[REUSE / INHERIT / REFERENCE]	[Source; pin if material]

LIFECYCLE / RELEASE CHECK

Draft -> Prove -> Release -> Maintain as needed -> Next release. Appendix explains; errata corrects; adopted amendment changes intent. Released SPEC stays frozen.
[] SPEC stable [] SYSTEM verified [] AI aligned / scoped [] MEMORY understandable
Conformance: **NOT YET PROVEN**. Effective SPEC / adopted changes / four-commit snapshot: [project-local reference].
main1 = original root. New lanes start there; existing adoption may start at a reviewed commit. Matching lane lineage continues; main = accepted integration.

[PROJECT / PRODUCT]

Project repository: [owner/repository] / Owner: [responsible person or team]

ROUTES, RUNS & ADOPTION

Use this page when the primary path, proof boundary or adoption context needs room. Omit unused detail.

R-01 / ROUTE DEFINITION

Route baseline: [SPEC/version + exact reference]. Clauses: [IDs]. Boundary: [input -> output]. Expected result: [observable assertion].

[input] -> [touchpoint 1] -> [touchpoint 2] -> [output]

A route is stable within its baseline; a run is an execution, not an iteration. Add R-02 only for another critical path. Do not shrink a route to match a passing subset.

REUSABLE RUN SHEET / SHOW BEFORE EXECUTION

Run: [unique ID/date]. Implementation: [commit/artifact]. Environment: [host/versions]. SPEC + adopted changes: [exact references]. Route: R-01 at [baseline].

REQUIRED TOUCHPOINT	OBSERVATION / ASSERTION	RESULT	EVIDENCE
[input]	[Observed input/event]	NOT RUN	[Evidence]
[touchpoint 1]	[Expected participation]	NOT RUN	[Evidence]
[touchpoint 2]	[Expected participation]	NOT RUN	[Evidence]
[output]	[Expected visible result]	NOT RUN	[Evidence]

Outcome: [expected / observed]. Route result: **NOT YET PROVEN**. Every point needs evidence from the connected workflow; any unreached point remains NOT RUN.

A negative route may PASS when its expected rejection is verified. Fixtures, stubs, E2M and M2E prove only the declared scope. Do not prefill success or reuse a prior run result automatically.

EXISTING PROJECT / ADOPT THE PRESENT

Study code, documentation and runtime as needed. Record the current repository/commit, scope and known gaps. Separate OBSERVED / AS-IS from ADOPTED / INTENDED behavior. A bug does not become law because it exists.

Iterations are optional for existing projects, including future iteration plans. Preserve history and justified lane names. Prove representative routes only for the claims made; a partial adoption baseline is not universal certification.

MIDPOINTS, OWNERSHIP & REUSE

M = [named contract/interface]. Parallel paths must agree there; verify their shared state or integration. A runtime route crosses AI only when AI actually participates. Unchanged touchpoints can be verified without edits.

REUSE	Use a capability without automatically adopting its source law.
INHERIT	Explicitly adopt a named requirement/version/scope into project SPEC.
REFERENCE	Consult knowledge/evidence without adopting its normative authority.

One authoritative owner per artifact. Agent-written product code is SYSTEM; AI instructions are AI; adopted promises are SPEC; rationale and handover are MEMORY.

SUPPORTING SPEC / ONLY WHEN USEFUL

Appendix: [optional study/diagram/example]. Errata: [optional correction]. Amendments: [optional adopted changes]. No mandatory empty documents, YAML, route database or iteration ledger.
