

[PROJECT / PRODUCT]

Repository: [owner/repository] / Owner: [person or team]

Purpose. [Who benefits and what this delivers.] Scope: [included behavior and exclusions].

SPEC / spec-vN FSL first; scope, promises, checks and routes. Appendix, errata or amendments when useful.	SYSTEM / system-vN Delivers the product or skill, including its checks.
AI / ai-vN Owns AI-specific instructions and capabilities. Declare inactive scope.	MEMORY / memory-vN Keeps decisions, context and evidence links; never creates law.

SPEC + MEMORY stay fixed; SYSTEM / AI are defaults. Squares own artifacts; routes cross only the artifacts needed for the claimed outcome.

CONTRACT

MUST / MUST NOT bind. SHOULD / SHOULD NOT guide. MAY permits.

LAW-[SCOPE]-001. [Subject] MUST [observable requirement]. Check: [evidence].

CONTRACT-[SCOPE]-002. [Interface] MUST [observable promise]. Check: [evidence].

GUARD-[SCOPE]-003. [Operation] MUST NOT [forbidden effect]. Check: [evidence].

E2E ROUTE

R-01. [input] → [touchpoint 1] → [touchpoint 2] → [output].

Expected. [Observable outcome and boundary]. Clauses: [IDs].

Route defines expected coverage; run records observed coverage. Show every touchpoint before each run; retain PASS, FAIL or NOT RUN and evidence in the log. A partial pass MUST NOT be called E2E proof.

Development. Iterate: one focused work-and-check loop; several runs may use the same route. New projects SHOULD begin with four E2E learning goals: tiny complete path → useful behavior → boundary/recovery → intended-use rehearsal → grow. Repeat or split as needed; this is not release approval. Existing projects adopt a reviewed baseline; iterations remain optional. Parallel E2E / E2M / M2E MAY help; M names the shared contract.

References. [Item and intended use] — [canonical source; adopted force and clause ID if binding].

Lifecycle. Review draft changes directly. Keep released SPEC unchanged. Appendix explains; errata corrects without changing intent; adopted amendments change intent. A proposal is not approval.

Release check. Review the four squares together: SPEC stable; SYSTEM verified; AI aligned or explicitly inactive; MEMORY understandable.

Baseline. [Effective SPEC + adopted changes + route reference + exact four-commit snapshot]. Run evidence: [project-local log]. Conformance: NOT YET PROVEN.

main1 = original first commit, fixed. New lanes begin there; existing projects may adopt a reviewed baseline. Matching lanes advance vN → vN+1; main = accepted integration. vN follows the project, not the template.
