

[PROJECT / BUSINESS / PRODUCT]

Project/contract: [vN; draft or adopted]. Document home: [repository/path]; related repositories: [links or NONE]. Steward: [name]. Decision authority: [name, scope, approval record]. FSL method/template: v1.10; identify the adopted project baseline.

Purpose. [Who is served, the business outcome and value.] **Boundary.** [Scope, exclusions and constraints.] **Authority.** [Completed FSL + adopted supporting documents, versions and approval record.] These documents govern agreed intent. The steward maintains alignment; the named authority approves intent. Skills support; evidence verifies outcomes. Skill advice, access or assignment does not confer approval.

SPEC / spec-vN — FSL first; adopted project DNA: business rules, commitments, contracts, acceptance and routes. Optional appendix, errata and amendments.	SYSTEM / system-vN — [Deliverable, operating work and checks: services, code, data, documents or instructions.]
AI / ai-vN — [AI-specific maintenance/working instructions and capabilities, or inactive scope.]	MEMORY / memory-vN — [Decisions, rationale, limits, handover and evidence links.]

SPEC and MEMORY stay fixed; retain justified alternatives to SYSTEM / AI. One or several repositories; one authoritative home per artifact.

Key promises

- LAW-[SCOPE]-001.** [Owner] **MUST** [observable business or product commitment]. Check: [evidence].
- CONTRACT-[SCOPE]-002.** [Service/interface] **MUST** [observable promise]. Check: [acceptance evidence].
- GUARD-[SCOPE]-003.** [Actor/process] **MUST NOT** [forbidden effect]. Check: [boundary evidence].

Formation / lineage

Project cell. [Primary expression and adopted DNA baseline.] **Sister cells.** [NONE, or named candidates + purpose + inherited baseline.] **Variation boundary.** [What **MAY** vary / what stays fixed.] **Advancement authority.** [Who may create, compare, select/adopt; bounds.] Keep state/evidence separate; inherit no permission or PASS. Review affected routes before promotion. A combination is a new candidate. Record selection/baseline; only adopted SPEC revision creates a DNA generation.

Critical route

R-01: [Input] → [required touchpoints] → [observable outcome]. **Expected:** [result and exclusions]. Clauses / baseline: [IDs / revision]. Add another route only when needed.

Route defines expected coverage; run records observed coverage. Show each point before a run; keep PASS / FAIL / NOT RUN and evidence in the log. Partial proof is not E2E.

Working approach. [New: tiny path → useful behavior → boundary/recovery → intended-use rehearsal; existing: study → reviewed baseline → verify → improve.] Choose the simplest sufficient path; preserve required coverage. Actions: OFF. Before Actions execution, estimate calls and ask for scoped approval with rate, task-total and expiry limits; no approval means zero starts. Required gates stay binding.

References. [Essential choice, purpose, canonical source; clause if binding.] **Current view [date].** Baseline: [effective documents + changes + compatible revisions/snapshot]. Routes/evidence: [links]. Supported: [scope]; unproven: [scope]; drift: [finding or not reviewed]. Next decision / owner: [question / name or unassigned]. Conformance: **NOT YET PROVEN** until supported. Keep live updates outside frozen SPEC.

Lifecycle. Review drafts directly. Preserve released SPEC. Appendix explains; errata corrects without changing intent; adopted amendments change intent. Proposal is not approval.

Release / lineage. [Owner] reviews the combination. Source baseline / retained work / changes: [reference when relevant]. Preserve main1/history and compatible revisions. A copy inherits neither approval nor a successful run; assess evidence for the new setting. Existing projects adopt the present. Extend to two or three pages only when needed.
